                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                        (ELIL ) LILLY & CO ELI.

in which His at position 10 of the mature wild-type protein C. sequence (see AAB82673) is substituted with Gln, Ser at position 11 with Gly, Gln at position 32 with Gly, Asn at position 33 with Asp, and Leu at position 32 with Ser. It is an example of protein C derivatives of the invention that have at least 2 amino acid substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type

                                                                                                                                                                                                                                                                to the native polypeptide. The polypeptide is used to treat a clott disorder by decreasing or increasing clot formation. Modification of GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                                                                                                                        This sequence represents a modified GLA (gamma-carboxyglutamic domain. The invention relates to a vitamin K-dependent polypept comprising a modified GLA domain containing an amino acid subst

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C. Protein C derivatives are useful in the manufacture of a medicament for the treatment of acute coronary syndromes e.g. myogardial infarction and unstable angina; and disease states predisposing to thrombosis; vascular occlusive disorders and hypercoagulable states e.g. disseminated intravascular coagulation (DIC), burns, transplantations, thalassaemia, sickle cell disease, viral haemorfhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing protein; thrombotic disorders in combination
Human; protein C derivative; anticoagulation activity; thrombosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  serpin inactivation; acute coronary syndrome; myocardial infarct vascular occlusive disorder; hypercoagulable state; angina; seps disseminated intravascular coagulation; DIC; burn; transplantati sickle cell disease; viral haemorrhagic fever; protein C deficte haemolytic uremic syndrome; acute arterial thrombotic occlusion;
                                                                                                                                                                                                                                                                                                                                                                              thrombolytic agent. Nucleic acid molecules of the invention are useful for treating humans with genetically predisposed prothrombotic disorders by gene therapy. The present sequence is human protein C derivative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein C derivative for treating acute coronary occlusive disorders, thrombotic disorders and sep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-AUG-2001

Human

protein C

derivative

Human; protein C derivative; anticoagulation activity; thrombosis;

```
thalassaemia, sickle cell disease, viral haemorrhagic fever and haemolytic uremic syndrome; sepsis in combination with bacterial permeability increasing protein; thrombotic disorders in combinatiwith an anti-platelet agent; protein C deficiency; acute arterial thrombotic occlusion, thromboembolism or stenosis in coronary, cent or peripheral arteries or in vascular grafts in combination with a composition of the combination with a composition of the combination with a composition of the combination with a combination with
                                                                                                                                                                                                                                                                                                                                                                                                                                                              molecules encoding such derivatives. These derivatives have increased anticoagulation activity, resistance to serpin inactivation and increased sensitivity to thrombin activation compared to wild type protein C, and retains the biological activity of the wild type human protein C. Protein C derivatives are useful in the manufacture of a medicament for the treatment of acute coronary syndromes e.g. myocardial

myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA methods is claimed. The protein C derivatives are useful for treating coronary syndromes and disease states predisposing to thrombosis (e.g. myocardial infarction and unstable angina), vascular occlusive disorders and hypercoagulable states, sepsis (in combination with bactericidal permeability increasing protein or with tissue factor pathway inhibitor), thrombotic disorders (in combination with an anti-platelet agent or by local delivery through an intracoronary catheter), protein C deficiency, acute arterial thrombotic occlusion, thromboembolism, or stenosis in coronary, cerebral or peripheral arteries or in vascular grafts, luman patients with genetically predisposed prothrombotic disorders may be treated by gene therapy (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a claimed human protein C derivative in which Ser at amino acid position il of the mature wild-type protein C sequence (see AAB82673) is substituted with Gly, Gln at position 32 with Glu, Asn at position 33 with Asp, and Leu at position 194 with Ser. The protein is an example of protei C derivatives of the invention that have at least 2 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 substitutions, but which have increased anticoagulant activity and resistance to inactivation by serpins compared with the wild-type protein, while retaining the biological activity of the wild-type

A method of producing the derivatives using recombinant DNA methods is claimed. The protein C derivatives are useful for treating coronary syndromes and disease states predisposing to thrombosis (e.g. myocardial infarction and unstable angina), vascular occlusive disorders and hypercoagulable states, sepsis (in combination with bactericidal permeability increasing protein or with tissue factor pathway inhibitor), thrombotic disorders (in combination with an anti-platelet agent or by local delivery through an intracoronary catheter), protein C deficiency, acute arterial thrombotic occlusion, thromboembolism, or stenosis in coronary,

                                                                                                                                                   This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.

to the native polypeptide. The polypeptide is used to disorder by decreasing or increasing clot formation. w GLA domain results in a protein which has enhanced mem affinity as compared to the native protein.

domain. The invention relates to a vitamin K-dependent polypept comprising a modified GLA domain containing an amino acid substwhich enhances membrane binding of the modified polypeptide as

ependent polypeptide amino acid substitution

Modification eptide as compared treat a clotting Modification of the This sequence represents a modified GLA (gamma-carboxyglutamic acid)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                  which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a modified GLA (gamma-carboxyglutamic actionmain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitute.
                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 79; 86pp; English.

The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vitamin K-dependent polypeptide with modified gamma-carboxyglutamic acid domain, useful for treating clotting disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 6; Page 78; 86pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Misc-difference

                                                                                                                                                                                     This sequence represents a modified GLA (gamma-carboxyglutamic acid) domain. The invention relates to a vitamin K-dependent polypeptide comprising a modified GLA domain containing an amino acid substitution which enhances membrane binding of the modified polypeptide as compared to the native polypeptide. The polypeptide is used to treat a clotting disorder by decreasing or increasing clot formation. Modification of the GLA domain results in a protein which has enhanced membrane binding affinity as compared to the native protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key Location/Qualifiers

## ALIGNMENTS

HO i .	
otein C (activated) (EC 3.4.21.69) precursor - human	
Alternate names: autoprothrombin IIA; plasma protein C	
Species: Homo sapiens (man)	
Date: 17-Mar-1987 #sequence_revision 17-Mar-1987 #text_change 16-Jul-1999	
Accession: A22331; A25426; A21781; A23789; A00927	
Foster, D.C.; Yoshitake, S.; Davie, E.W.	
oc. Natl. Acad. Sci. U.S.A. 82, 4673-4677, 1985	
Title: The nucleotide sequence of the gene for human protein C.	
Reference number: A22331; MUID:85270390; PMID:2991887	
Accession: A22331	
Molecule type: DNA	
Residues: 1-461 <fos1></fos1>

coagulation factor VII - rabbit
C:Species: Oryctolagus cuniculus (domestic rabbit)
C:Date: 04-Sep-1997 #sequence_revision 04-Sep-1997
C:Accession: 146932
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    F;103/Modified site: erythro-beta-hydroxyaspartic acid.(Asp) #status exper F;199,211/Binding site: carbohydrate (Thr) (covalent) #status experimental F;221,231/Binding site: carbohydrate (Asp) (covalent) #status experimental F;234-235/Cleavage site: Arg-Ile (coagulation factor IXa, coagulation factor F;276,322,419/Active site: His, Asp, Ser #status experimental

                                           INTO A LIGHT CHAIN AND A HEAVY CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE ENZYME IS THEN ACTIVATED BY THROMBIN, WHICH CLEAVES A TETRADECAPEPTIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS REACTION, WHICH OCCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLY PROMOTED BY THROMBOMODULIN.

-I- TISSUE SPECIFICITY: PLASMA; SYNTHESIZED IN THE LIVER.
-I- TISSUE SPECIFICITY: DASMA; SYNTHESIZED IN THE LIVER.
-I- MISCELLANEOUS: CALCUM ALSO BINDS, WITH STRONGER AFFINITY TO ANOTHER SITE, BEYOND THE GLA DOMAIN. THIS GLA-INDEPENDENT BINDING ANOTHER SITE, BEYOND THE GLA DOMAIN. THIS GLA-INDEPENDENT BINDING THROMBOMODULIN COMPLEX.
-I- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1.
                                                                                                                                                                                                                                      region of mammalian protein C.";
